ABSTRACT. Energy gaps, $\Delta X_{S-t}$ ($X = E, H$ and $G$) ($\Delta X_{S-t} = X_{\text{singlet}} - X_{\text{triplet}}$) between singlet (s) and triplet (t) states of aryl substituted cyclopentadienylidene, Ar-C$_4$H$_3$C, were calculated at B3LYP/6-311++G**. Electron donating substituents ($G = \text{-NH}_2, \text{-OH}, \text{-CH}_3, \text{-F, -Cl and -Br}$) at phenyl group cause to increase and electron withdrawing substituents ($G = \text{-CF}_3$ and $\text{-NO}_2$) lead to decrease the singlet-triplet energy gaps of Ar-C$_4$H$_3$C. The results of the singlet-triplet gap calculations were fully supported by HOMO-LUMO gaps.

KEY WORDS: Carbene, Cyclopentadienylidene, Singlet-triplet gap, Electronic effects

INTRODUCTION

Divalent carbenes and their analogues are strongly reactive [1]. The cyclic completely conjugated species are important in the chemistry of divalent carbene intermediates [2]. These divalent structures were formerly described in terms of the Hückel $4n + 2$ rule [3]. However, non-planar isomers have found minimum energy for the most of these singlet cyclic conjugated carbenes through semi-empirical studies [4]. The isolation of the stable five membered cyclic conjugated carbene has firstly been reported by Arduengo [5]. Since most of divalent carbenes and their analogues are unstable, theoretical calculation was required to analyze the carbene properties. As a continuation of our studies [2, 6], in this manuscript, the effects of electron donating substituents ($G = \text{-NH}_2, \text{-OH, -CH}_3, \text{-F, -Cl and -Br}$) and electron withdrawing substituents ($G = \text{-CF}_3$ and $\text{-NO}_2$) of aryl groups on the singlet-triplet energy gaps in cyclopentadienylidenes Ar-C$_4$H$_3$C was investigated.

CALCULATION METHOD

Full geometry optimizations of Ar-C$_4$H$_3$C ($G = \text{-NH}_2, \text{-OH, -CH}_3, \text{-F, -Cl, -Br, -H, -CF}_3$ and $\text{-NO}_2$) were carried out by Density Functional Theory, DFT, method using 6-311++G** basis set of the GAUSSIAN 98 program [7-9] (Scheme 1).

\[ G = \text{-NH}_2, \text{-OH, -CH}_3, \text{-F, -Cl, -Br, -H, -CF}_3 \text{ and -NO}_2 \]

Scheme 1. Electron donating substituents ($G = \text{-NH}_2, \text{-OH, -CH}_3, \text{-F, -Cl and -Br}$) and electron withdrawing substituents ($G = \text{-CF}_3$ and $\text{-NO}_2$) of cyclopentadienylidenes.

To find a global minimum on a specific surface, all possible conformations of the given species were examined through scanning the specific dihedral angles at B3LYP/6-311+G** level. This was for obtaining more accurate values of thermal energies (E), enthalpies (H) and Gibbs free energies (G). “Freq” keyword was used for obtaining thermal energies (E), enthalpies (H) and Gibbs free energies (G). All calculations were carried out for gas phase at 298 K temperature and 1 atm pressure.

RESULTS AND DISCUSSION

The total energies, $E_T$, thermal energies (E), enthalpies (H) and Gibbs free energies (G) were calculated for the singlet and triplet states of substituted aryl divalent five membered cyclic compound $\text{Ar-C}_4\text{H}_3\text{C}$ (G = -NH$_2$, -OH, -CH$_3$, -F, -Cl, -Br, -H, -CF$_3$ and -NO$_2$) at B3LYP/6-31+G* and B3LYP/6-311++G** levels of theory. Considering the size of molecules probed, and the consistency of the results obtained, these ab initio levels proved to be appropriate. For the sake of brevity, only the data acquired through the highest level of theory (B3LYP/6-311++G**) are reported (Scheme 1 and Table 1). Total energy gaps, $\Delta E_{s-t}$, thermal energy gaps, $\Delta E_{th}$, enthalpy gaps, $\Delta H_{th}$, Gibbs free energy gaps, $\Delta G_{th}$, between singlet (s) and triplet (t) states of $\text{Ar-C}_4\text{H}_3\text{C}$ were calculated at B3LYP/6-311++G** (Table 2). For facility, the Gibbs free energy gaps, $\Delta G_{th}$, was selected to discussion of the data.

Table 1. Sum of total energy, $E_T$; zero point energy, ZPE; thermal energy, (E); thermal enthalpy (H); thermal free energy (G) at B3LYP/6-311++G** for both singlet (s) and triplet (t) states of Ar-C4H3C.
The DFT calculations indicate that all the singlet state of Ar-C_4H_3C is ground state with non-planar conformer while all the triplet state of Ar-C_4H_3C is ground state with planar conformer (Table 1).

DFT calculations specify that all triplet states of Ar-C_4H_3C (G = -NH_2, -OH, -CH_3, -F, -Cl, -Br, -H, -CF_3 and -NO_2) is more stable than those corresponding singlet states. Calculated \( \Delta G_{s-t} \) shows that the electron donating substituents (G = -NH_2, -OH, -CH_3, -F, -Cl and -Br) at phenyl group cause to increase \( \Delta G_{s-t} \) and the electron withdrawing substituents (G = -CF_3 and -NO_2) lead to decrease the \( \Delta G_{s-t} \) of Ar-C_4H_3C. Therefore, changing substituents at phenyl groups from an electron donating toward an electron withdrawing groups lead to decrease the \( \Delta G_{s-t} \). Relative energy analysis reveals that the substitution of the electron donating groups at phenyl group leads to the stability of the triplet state (respect to those corresponding singlet state) while the substitution of the electron withdrawing groups leads to the stability of the singlet state (respect to those corresponding triplet state).

The electron withdrawing groups at phenyl groups enforce a higher percentage of s-character on nonbonding electrons at the carbenic center of Ar-C_4H_3C. The higher s-character of nonbonding electrons leads to the stability of the singlet state as well as decrease the singlet-triplet gap \( \Delta G_{s-t} \). Furthermore, the electron withdrawing groups at phenyl groups cause a high polarity of -C-C in the direction :C^+ -C^- . Strongly polarized bond leads to more stability of the singlet state as well as decrease the singlet-triplet gap \( \Delta G_{s-t} \).

The HOMO-LUMO gaps of Ar-C_4H_3C were calculated at B3LYP/6-311++G** level. The HOMO-LUMO gaps could be explained the energy changes of the singlet and triplet states [10, 11]. The results of the singlet-triplet gap \( \Delta G_{s-t} \) calculations are fully supported by HOMO-LUMO gaps (Table 2). HOMO-LUMO gaps were increased with the substitution of the electron withdrawing groups at phenyl group. In contrast, the HOMO-LUMO gaps are decreased with the substitution of the electron donating groups at phenyl group. Higher HOMO-LUMO gaps lead to increase the stability of singlet state as well as decrease of the singlet-triplet gap \( \Delta G_{s-t} \).

Table 2. Total energy gaps, \( \Delta E_{s-t} \), thermal energy gaps, \( \Delta E_{s-t} \), thermal enthalpy gaps, \( \Delta H_{s-t} \), thermal free energy gaps, \( \Delta G_{s-t} \), between singlet (s) and triplet (t) states and LUMO-HOMO gaps of Ar-C_4H_3C at B3LYP/6-311++G**.

CONCLUSIONS

Calculated $\Delta G_{s-t}$ show that the electron donating substituents ($G = -NH_2, -OH, -CH_3, -F, -Cl$ and $-Br$) at phenyl group cause to increase $\Delta G_{s-t}$ and the electron withdrawing substituents ($G = -CF_3$ and $-NO_2$) lead to decrease the $\Delta G_{s-t}$ of Ar-C_4H_3. Relative energy analysis reveals that the substitution of the electron donating groups at phenyl group leads to the stability of the triplet state (respect to those corresponding singlet state) while the substitution of the electron withdrawing groups leads to the stability of the singlet state (respect to those corresponding triplet state).

AKNOWLEDGEMENTS

We express our special thanks to Payame Noor University, Zanjan Branch for his financial support.
