THE SYNTAX OF MULTI-WORD EXPRESSIONS IN YORULISH CODE-MIXING

MT Lamidi

Abstract

Scholars have discussed Yorulish (Yorùbá–English) code-switching/mixing from the perspectives of sociolinguistics, contact linguistics and pragmatics, among others; but the syntax–semantics aspect has not enjoyed much scholarly scrutiny, if any. Multi-word expressions (MWEs) are characterised by non-compositionality as they comprise two or more words, which have a unique meaning not traceable to any of the combined words. This study examines the syntactic behaviour of MWEs in Yorulish code-switched grammar, with an eye to the meaning before and after code-switching/mixing. The adopted theoretical framework is a combination of Myers-Scotton’s Matrix Language Frame theory and Chomsky’s Transformational Generative Grammar. Data were purposively sampled from standard dictionaries and textbooks on English and Yorùbá languages, and code-switched/mixed with words from the alternate language. The MWEs selected are idioms (from English and Yorùbá); phrasal verbs, phrasal-prepositional verbs and prepositional verbs (from English); and splitting verbs and serial verb constructions (from Yorùbá). The study suggests that switching is allowed when components of MWEs are relatively free as in English prepositional verbs, but barred when they are fixed as in Yorùbá splitting verbs and idioms. Nevertheless, apart from idioms where both English and Yorùbá substrates resist switching, the other Yorùbá MWEs are more imperious to switching than do those of English origin, which suggests that Yorùbá is the base language.

Keywords: Yorulish, code-mixing, multi-word expressions, Matrix Language Frame theory

1. Introduction

Yorulish is a term coined by Lamidi and Ajongolo (2001). It is a blend of Yorùbá and English, and refers to the combined substrates of Yorùbá-English code-mixed/switched linguistic variety. Code-switching is described as a switch from one
language to another in the course of speaking with respect to topic, tone, audience, situation, mood, etc. (Bentahila and Davies 1983). Code-mixing on the other hand is the mixture of words from languages in contact (Essien 1995). They are both referred to respectively as inter-sentential and intra-sentential code-switching (Muysken 2000). This study is based on intra-sentential code-switching, otherwise called code-mixing.

Multi-word expressions (MWEs) are words that are usually collocated everywhere they occur in sentences. Such expressions, which are found in different languages, include (but are not limited to) idioms (from English and Yorùbá), phrasal verbs, prepositional verbs, and phrasal-prepositional verbs (from English); and splitting verbs and serial verbs (from Yorùbá). This paper discusses all MWEs identified in the preceding sentence. The MWEs refer to combinations of a lexical verb and one or more words or particles. The particles are either adverbs or prepositions or both. When the particle is an adverb, the multi-word combination is a phrasal verb. When the particle is a preposition, the combination is a prepositional verb; and when both adverb and preposition particles co-occur with the verb, the combination is a phrasal-prepositional verb (Quirk and Greenbaum, 1979; Greenbaum and Nelson, 2002; van Gelderen, 2010). All these originate from the English language.

The splitting verbs and the serial verbs discussed here originate from Yorùbá language. Splitting verbs have the peculiar nature of either occurring alone or being split into two (Awobuluyi 1978), whereas serial verbs refer to a series of verbs that occur adjacent to one another in a structure (Lawal 1986). Regardless of the combination, the MWE constitutes a unit of meaning; it is not necessarily an aggregate of the meaning of the individual components. The combined words behave like a single verb. In this paper, the behaviour of MWE verbs in Yorulish code-switching is explored within the purview of Matrix Language Frame and Transformational Generative Grammar, a competence grammar. The paper looks at issues of compositionality, grammaticality and acceptability.

2. Syntax-semantics interface in Yorulish Code-switching

This eclectic study is being carried out from a combination of different theories and concepts. The first is Matrix Language Frame (MLF), propounded by Myers-Scotton. Myers-Scotton (1993b, 2002) has tried to formalise a psycholinguistic/grammatical theory of code-switching. She presents the Matrix Language Frame (MLF), which posits the occurrence of a main or base (or host) language and an embedded language in a code-switched grammar. The main language is said to donate most of the functional categories in a code-switched structure. She justifies this through the two twin concepts of (i) Morpheme Order Principle, in which case the order of the morpheme will be in
the Matrix Language (ML) structure and (ii) System Morpheme principle, in which the system morphemes come from the host language.

The second is Chomsky’s transformational generative grammar (TGG). Although TGG has many models, this paper will be concerned with the concept of competence, which runs through them all. Competence is the ideal native speaker/hearer’s ability to use a language flawlessly. This study is located in this theory, since it is concerned with the acceptability and grammaticality of expressions. A sentence is grammatical if it obeys all the relevant rules guiding the formation of the sentence; otherwise, not. Borsley (1991) draws a line between grammaticality and acceptability. A structure that is grammatical may be acceptable or unacceptable. A structure that violates the rule(s) of grammar is unacceptable. When a structure is too long for the perceptive ability of an individual, it is considered unacceptable. In the same vein, a sentence that requires pen and paper analysis before it can be understood is also unacceptable. This study will be looking at structures in the context of the switching of codes from one to the other of the languages involved in code-switching. In this sense, the switch from one code to another is a major means of determining whether a structure is grammatical or acceptable. In other words, if a structure tolerates switching, the product of switching will be grammatical and acceptable. If, however, a structure resists switching, the product of switching any of its components will be considered ungrammatical and unacceptable.

Of particular relevance to this study is the concept of head. The head is the most important word in a phrase. It is unique and obligatory in phrases. The head has been defined by many scholars (such as Jackendoff, 1977 and Chomsky, 1986); but we shall be guided by the definitions offered in Hoeksema (1990: 2):

(A) Semantic: The head of A is a hyperonym of A, i.e. when A denotes a set X, the example of A denotes a superset of X
(B) Distributional: The head of X is a part with the same distribution as X.
(C) Morphosyntactic: The head is the locus of Inflection
(D) Technical: The head of X is the part, which determines the category of X.

This study adopts these definitions as they determine the grammaticality and acceptability of elements under the scope of the head. The study focuses particularly on the implication of the technical and semantic definitions because they account for subcategorisation and semantic selection features.

While syntax deals with the arrangement of words in an expression, semantics deals with the meaning of such expressions. Regardless of the syntactic structure, words
can occur freely or co-occur with other words regularly with constant meaning (collocation). One area of syntax–semantics interface is compositionality. “Compositionality refers to the degree to which the meaning of a MWE can be predicted by combining the meanings of its components” (Korkontzelos and Manandhar, 2009: 65). MWEs or collocated expressions are said to be compositional if each word contributes to the totality of the meaning of an expression. According to Carnie (2010: 22),

The hypothesis of compositionality holds that the syntactic tree is the road map for this semantic computation. That is, semantic composition applies precisely in the order specified by the hierarchical constituent structure. If two elements x and y form a constituent excluding z, then the meaning of the (x, y) pair is computed before z is added into the mix.

This means that words participate structurally and semantically in the realization of the structure and meaning of expressions. Each word has a meaning and belongs to a syntactic category. So, when a word is removed from an expression, it leaves a gap in the structure and meaning of the expression. For instance, the expression, a young man, is compositional, referring to a male that has not matured. If we remove young, the meaning is reduced because the meaning of young has been left out in the overall interpretation.

Conversely, a structure is not compositional if we cannot identify the contribution of each of its component parts. In other words, all the words in the structure form a unit of meaning. In this sense, when a word is removed from the group, the initial meaning is disrupted or unrealised. Rather, we get a literal meaning or a nonsense meaning. The whole expression is listed in the lexicon as a unit of meaning. In the following example, for instance, if any word is taken away, the total meaning collapses. In eat humble pie, if we take away humble, the meaning changes and becomes compositional: eat pie. This is a literal translation. Sometimes, however, certain collocated expressions can be twisted or modified. This, however, makes the expression susceptible to literal translations or changes in meaning. For instance, look can be collocated with different particles or prepositions. Hence, we have look out (be vigilant/face), look in (look briefly) and look for (search for). Considering the different meanings indicated against each expression in the brackets, the first two belong to MWEs, the last does not. The expressions with deep/embedded meaning as opposed to those with literal meanings include idioms and metaphors. Regardless of the compositional status of MWEs, however, there is an internal unity orchestrated by the head and the complements in conformity with the rules of the language. If, for instance, a syntactic rule is broken,
the expression becomes unacceptable. Hence, MWEs also have internal syntactic rules guiding their components.

Given the fact that a set of words also with unified meaning allows splits or interchange with particles and some expressions have a unified meaning for a number of words without switches, this study investigates the phenomenon of code-mixing in both cases, to see the speech patterns and how mixing occurs as well as how meaning is affected by the phenomenon. With MLF theory in the background, and Competence and Compositionality at the forefront, the paper is expected to distinguish between literal and idiomatic expressions through the phenomenon of code-mixing. This study looks at the syntax-semantics relationship of words within MWEs. We examine how MWEs behave when they are code-mixed and identify what makes them grammatical or ungrammatical.

3. Previous studies

Several studies in code-switching have been carried out on different aspects of the phenomena. These include the motivation for switching between languages (Myers-Scotton 1993a, Auer 1998), classification of switches (Muysken 2000), psycholinguistic perspectives on code-switching (Green 1998, Treffers-Daller 1998, Toribio 2001), the grammatical basis of code-switching as well as constraints that apply to each pair of mixed languages (Poplack 1980, Bentahila and Davies 1983, Myers-Scotton 1993b, 2000, MacSwan 2000, van Gelderen and MacSwan 2008), bilingual children’s code-switching (Treffers-Daller 1998, Hoeksema 1990, Carnie 2010, Cantone & Müller 2008, Liceras et al. 2008) and code-switching in e-mails (Hinrichs 2006). Many studies have also been carried out on pairs of languages, but very few exist on code-switching involving more than two languages (Ogechi 2002, Kyuchukov 2002) and, still less are studies on written code-switching especially on virtual speech communities (Montes-Alcalá, 2007; Lamidi, 2013).

Studies have also been conducted on pairs of languages such as Spanish-English (Paff 1979; Poplack 1980, Sankoff and Poplack 1981, Franco and Solorio 2007); Arabic-French (Bentahila and Davies 1983), American Sign Language- English (Lucas and Valli, 1992), English-Creole (Hinrichs 2006), Swahili-English (Myers-Scotton 1993 a&b, 2002), Turkish-Dutch (Backus and Eversteijni 2002) and Yoruba-English (Banjo 1983, Goke-Pariola 1983, Lamidi 2013).

In Yoruba- English CS, the studies have been largely on sociolinguistics (see Banjo 1983, 1996; Goke-Pariola, 1983; Bamiro, 2006, Ayeomoni, 2006; and Babalola & Taiwo 2009) and on morphology and syntax (see Lamidi & Ajongolo, 2001; Lamidi 2003, 2004, 2008 a&b and 2013). Lamidi and Ajongolo (2001) discuss the morphosyn-
tactic structure of heads in Yorulish code-switched words. The study identifies morphemes from the Yorùbá substrate as heads of their respective code-switched words, thus confirming Myers-Scotton’s MLF theory. The same conclusion was reached in Lamidi (2004) which looks at the scopal authority of heads in the Yorùbá-English code-mixed grammar. According to the study, functional heads such as complementiser and determiner regulate the structure of a phrase; lexical heads determine the type of word that follows them. Both head types subcategorise or determine the structure of their complements (which fall within their scope). The study concludes that Yorùbá is the Matrix language. These two papers are relevant to the current effort, which also discusses Yorùbá-English code-mixing. It is important to emphasise that the current study involves syntax-semantics interface, which the earlier study did not consider. The study will benefit from the concept of head and scopal authority within phrases. It will explore grammaticality and acceptability from the perspective of subcategorisation and s-selection.

Another relevant study is Lamidi (2008a). It investigates hybrid verbs in Yorùbá-English code-mixing. The study identifies clean verbs, which exhibit the normal features of verbs from English and Yorùbá from their respective source substrates, and hybrid verbs, which have idiosyncratic features different from what obtains in their respective source languages. Lamidi (2004) is principally on how a head regulates the items that are dependent on it in its scope and Lamidi (2008a) is principally on the nature of lexical verbs. However, the current study is on multi-word expressions; and, to my knowledge, no study so far has discussed Yorùbá-English code-mixing in multi-word expressions, least of all, its syntax-semantics interface, grammaticality and acceptability, which are the foci of the current paper. Therefore, the current study pushes forward the discussion in Lamidi (2008a) as it explores the behaviour of a variety of code-switched MWE structures in different contexts.

4. Data Collection

Data comprising MWEs were collected from the Oxford Advanced Learners’ Dictionary of English (for English language) and Awobuluyi (1978) (for Yorùbá language). Additional data were also generated through introspection by the researcher, who has native speaker competence in Yorùbá. The data collected were phrasal verbs, prepositional verbs and phrasal prepositional verbs (from English); serial verb constructions, splitting verbs (from Yorùbá); and idioms (English and Yorùbá). Of all these, those MWEs that are relatively in common use among the Nigerian populace were purposively selected for code-mixing with the other language. The data from English were code-mixed with words from Yorùbá while data from Yorùbá were code-
mixed with words from English. Idioms from English were code-mixed with words from Yorùbá while idioms from Yorùbá were code-mixed with words from English. The products of the code-mixing processes were analysed for grammaticality and acceptability. In the data that follows, English expressions are presented in italic typeface while Yorùbá expressions have normal typeface. This is to distinguish the two codes in each structure. The MWEs are presented in bold print.

5. Phrasal Verbs

A phrasal verb consists of a verb and an adverb, both forming a unit of meaning. However, in English grammar, because the adverb ‘no longer always expresses place or direction’ (van Gelderen, 2010: 91), it is called a particle in this context. Quirk and Greenbaum (1979) have classified phrasal verbs into two: intransitive phrasal verbs and transitive phrasal verbs. In Yorulish grammar, the phrasal verb is contributed by the English substrate.

5.1 Intransitive Phrasal Verbs

Transitive phrasal verbs take objects while intransitive phrasal verbs do not. Here are some examples of intransitive phrasal verbs from the Yorulish grammar:

1a. \textit{Plane  yen  ti  take off.}
   Plane  the  ASP taken off
   ‘The plane has taken off.’

b. \textit{Olú turn up  ní  meeting  yen  unexpectedly.}
   Olú turned up  at  meeting  that  unexpectedly
   ‘Olu turned up at the meeting unexpectedly.’

c. \textit{Sé  ó  ní  catch on?}
   Q  3SG  CONT catch on
   ‘Does s/he catch on?’

d. \textit{Man  yen  break down  lójìít.}
   Man  that  break down  suddenly
   ‘That man broke down suddenly.’
e. Ò ń play around
   3sg CONT play around
   ‘He’s playing around.’

The first observation about these sentences is that the system morphemes are usually from the Yorùbá substrate. Normally, Yorùbá verbs are always not inflected for tense and agreement. This lack of inflection also occurs on the first words in the phrasal verbs. In the foregoing examples, for instance, the tense and agreement features of English are replaced by the non-inflected form of Yorùbá, even on English verbs. In addition, function words such as perfective and progressive aspect markers (tǐ and ń respectively) are in Yorùbá. The clitic (ó), the determiner (yẹn) and the question marker (ṣé) are all donated by the Yorùbá substrate. In addition, following the Morpheme Order Principle, we can see that the word order favoured is that of Yorùbá. For instance, meeting yẹn has the structure N + Determiner, whereas the reverse, Determiner + N, is the structure permitted in English. English polar questions involve the use of auxiliary-NP inversion, but the polar question in (1c) uses a question marker that is attached sentence-initially. These features are peculiar to the Yorùbá substrate. In these and subsequent examples in this paper, these are the overriding features. Hence, we confirm that Yorùbá is the host language (following the ideas of Myers-Scotton, 1993) in the code-switched grammar under discussion as observed in previous literature.¹

Considering the examples from the perspective of MWEs, the phrasal verbs, as a unit, do not have objects. Rather, they are either left bare (1a, c & e) or followed by adverbials (1b & d). In all the examples, switching of other elements in the sentences are permitted but switching items within phrasal verbs to Yorùbá is not permitted. Otherwise, the sentence will be barred as in the following:

2a. *Olú take kúrò
b. *Olú turn lókè ní meeting yẹn unexpectedly.
c. *Man yẹn kán offlójíjí
d. *Ṣé o ń mú on?
e. *O ń play àyíká

¹To avoid repetitions of the same ideas, the status of Yorùbá as the host language in the code-switched grammar will not be pursued further in other examples below. Readers may wish to read up on the subject in Banjo (1983), Goke-Pariola, (1983) and Bamiro (2006), among others.
As examples (2a-e) show, switching of this class of phrasal verbs into Yorùbá causes ungrammaticality and is therefore barred. What accounts for the ungrammaticality? We can trace this to the heads of the phrasal verbs: take, turn, kán, mú and play. The heads, following the ideas of Lamidi (2004), have scope over the particles and determine the type of word that follows them and whether such words or particles can be switched from English to Yorùbá without negative repercussions. As observed in examples (2a-e), switching is not allowed between the head and the particle in the intransitive phrasal verb. However, a phrase of Yorùbá origin can come before and/or after the phrasal verb as seen in (1a-e). Hence, the intransitive phrasal verb can be seen as an embedded island (Myers-Scotton, 1993b). The structures also fail on the pedestal of acceptability. This is because the meanings do not tally with the intended ones depicted in the translations.

By invoking Hoeksema’s descriptions of head above, we can identify the words take, turn, catch, break and play as heads in their respective phrasal verbs in (1a-e). The heads have semantic content, which determines the meaning of the respective structures. They occur at the beginning of the expressions (Distributional content), they collocate with the particles and earn the structure its name (Technical content) and they are changeable, depending on agreement or tense factors: he turned up; she turns up (Morphosyntactic content). Hence, in this and subsequent examples from the English substrate, the first word in the MWE is the head.

This conclusion appears to contradict Williams’ (1982) Right Hand Head Rule, which states that the inflection to the head occurs at the right-hand side of the word. To accommodate this claim, we shall posit that the inflections occur to the right-hand side of the word which is within another structure. However, since this is beyond the scope of this paper, and it will no longer be pursued here.

5.2 Transitive phrasal verbs

As in lexical verbs, the transitive phrasal verbs require an object. This fact is exemplified in the following:

3a. Wọn switch on iná sitting room
    they switch on light sitting room
    ‘They switched on the light in the sitting room.’

b. A set up committee tuntun
    we set up committee new
    ‘We set up a new committee.’
c. **A ti call off strike yẹn**
   "We ASP call off strike that ‘We have called off that strike.’"

d. **Ọ fẹ́ find out nǹkan ti won ti plan**
   "3sg want find out what that they CONT plan ‘S/he wants to find out what they are planning.’"

e. **Ọun l’ó bring over òwọn boys yẹn.**
   "3sg FOC bring over PL boys that ‘It was s/he that brought over those boys.’"

In examples (3a-e), each of the sentences may not be complete if the noun phrases adjoining the phrasal verbs are removed. Hence, the phrasal verbs are transitive. The phrasal verbs in these examples also reject switching within the components of the phrasal verbs. However, they may allow Yorùbá words to come in-between them. In this sense, we cannot tag them as embedded language (EL) like their intransitive counterparts. Here are examples; they have the respective translations in (3) above.

4a. **Wón switch iná sitting room on.**
   b. **A set committee tuntun up.**
   c. **A ti call strike yẹn off.**
   d. **Ọ fẹ́ find nǹkan ti won ti plan out.**
   e. **Ọun l’ó bring òwọn boys yẹn over.**

Again, as the examples from both types of phrasal verbs show, switching is permitted within the sentences containing the multi-word, but the phrasal verbs are not switched into Yorùbá, as exemplified below:

5a. *Wón yí on iná sitting room.*
   b. *A set òkè committee tuntun.*
   c. *A ti pè off strike yẹn.*
   d. *Ọ fẹ́ find ita nǹkan ti won ti plan.*
   e. *Ọun l’ó mú over òwọn boys yẹn*
Examples (5a-e) demonstrate that switching is barred for this class of phrasal verbs. The question is: what is the nature of switching in these constructions? Consider the following additional examples with variations in switch patterns:

6a. Olú *give up*
   ‘Olu gave up.’
   b. *Olú give òkè*
   c. *Olú fún up*

7a. Ṣadé *give in*
   ‘Sade gave in.’
   b. *Ṣadé give inú*
   c. ”Ṣadé fún in

8a. Àwọn *terrorists blow up motor yen.*
    b. Àwọn *terrorists blow motor yen up.*
       ‘The terrorists blew up the vehicle.’
    c. *Àwọn terrorist fò motor yen up.*
    d. *Àwọn terrorists blow motor yen sókè.

In these sentences, the components of the phrasal verbs are switched either into Yorùbá or English (6b&c, 7b&c, 8c&d). While the first item is switched into Yorùbá in (6&7c) the second word is switched into Yorùbá in (6&7b). The position is reversed for (8c&d), respectively. In all cases, the result is ungrammatical and unacceptable.

Nevertheless, there are some good cases, which confirms that individual heads also determine the grammaticality and acceptability of the code-switched expressions:

9a. Ó ní *act fún president*
    ‘He’s acting for the president.’
    b. Wọn *adhere to/adhere by the rule*
    c. Wọn *adhere sí/abide pèlú rule yen*
       ‘They abided by/adhered to that rule.’

In these examples, *act for* becomes *act fún*, *adhere to/adhere by* becomes *adhere sí/abide pèlú*. Instances of these are not many in our data.

Hence, within phrasal verbs, switching components of the multi-word verbs into Yorùbá is usually disallowed as evidenced in the bad cases. The first reason given above is about the head determining what comes after it. This is a syntactic reason. The second possible reason, a semantic reason, is that the multi-word is a unified phrase
with a recurrent meaning. If switching is allowed in any of its components, the meaning may be lost or distorted. This is a confirmation that the phrasal verb is a form of idiom, as widely observed in the literature.

6. Prepositional verbs

Prepositional verbs contain a verb and a preposition; hence the name ‘prepositional verbs’. However, if we follow van Gelderen’s (2010) ideas, the preposition may be seen as a particle. Either way, it does not affect the analysis here; hence ‘preposition’ is adopted. In the following examples, there are different patterns regarding switching.

6.1 Prepositional verbs that reject switching

In this type of structure, switching is barred within components of a prepositional verb, though other constituents within the sentence in which the prepositional verb occurs may be switched. Consider the following; the prepositional verbs are typed in bold:

10a. Adé look after bàbá ẹ̀
    Ade looked after father his
    ‘Ade looked after his father.’

b. *Adé wo after bàbá ẹ̀

c. *Adé look léyín bàbá ẹ̀

11a. Excitement wọn ti die down
    Excitement their ASP die down
    ‘Their excitement has died down.’

12a. *Excitement wọn ti kú down
    b. *Excitement wọn ti die sílẹ̀
    c. *Excitement wọn ti kú sílẹ̀

13a. Wọn put off decision wọn
    They put off decision their
    ‘They put off their decision.’

b. *Wọn gbé decision wọn off

c. *Wọn put decision wọn kúrò
14a. Wón stand up nígba tó dé
They stand up when that: he arrive
‘They stood up when he arrived.’
b. *Wón stand dúró nígba tó arrive/when he arrived
c. *Wón dide up nígba tó arrive/when he arrived
d. Wón dide dúró when he arrived/nígba tó arrive

15a. Discussion go on fún ígba pípè
Discussion go on for time late
‘The discussion went on for a long time.’
b. *Discussion lọ on fún ígba pípè
c. *Discussion went ṣiwájú for a long time

In these examples, the first word in each prepositional verb is the head. The switching of either part of the prepositional verb is not allowed, as the starred (b &c) examples in all the examples show. Note, however, that in (14d), both components of the prepositional verbs are switched into Yorùbá. This is possible because the two words collocate in Yorùbá but a Yorùbá word and an English word that jointly form a prepositional verb may not collocate.

6.2 Preposition deletion pattern

Another pattern is that in which the English preposition is elided in the code-switched grammar, leaving only the lexical verb. Notice also that this elision does not affect the original meaning of the multi-word verb. This is another method of avoiding ungrammaticality in the code-switched grammar. Consider the example below.

16a. Ó approve of your behaviour
3sg approve of your behaviour
‘S/he approves of your behaviour.’
b. Ó approve – behaviour ẹ
c. Ó approve (?of) behaviour ẹ

In this example, the second part of the prepositional verb (of) occurs in (16a) in what Myers-Scotton (1993b) calls embedded language (EL) (a structure that is wholly of a particular substrate in a code-switched language and thus maintaining the rules of that language only). It is deleted in (16b), following the rules of the matrix language (in this case, Yorùbá). In (16c), however, the structure is of doubtful acceptability. Further data may be required to establish its status.
6.3 Prepositional verbs that permit switching

The third pattern is that in which the preposition is switched from English into Yorùbá. Again, the original meaning of the multi-word prepositional verb is not affected. This is exemplified in (17-22).

17a. *Principal* call fún water
‘The principal called for water.’
b.*Principal* call for omi

c. Heavy smoking ñ *lead to sí* cancer
‘Heavy smoking leads to cancer.’

18a. Ó *blame* accident yen on the driver (embedded language)
‘She/He blamed the accident on the driver.’
b. Ó *blame* accident yen l’órí driver.

19a. Ó lè *order* drink fún mi
‘He/she can order a drink for me.’
b. Ó lè *order* drink for *me* (embedded language)

20a. Ó *explain* fún mi
‘He/She explained to me.’
b. Ó *explain* to *me* (embedded language)

21a. Ó *forgive* mi fún rude remarks mi
‘He/She forgave me for my rude remarks’
b. Ó dári jì mí for my rude remarks (embedded language)

22a. Ó *congratulate* è fún convocation è
‘She/he congratulated him/her on his/her convocation’
b. Wón abide pèlú terms wa
‘They abided with our terms’
c. Ó *refer sí* article yen
‘He/she referred to that article.’

In these examples, the prepositional verbs are call for, lead to, blame on, order [something] for, explain to, forgive for and congratulate on. These are switched respectively, to call fún, lead sí, blame lórí, order fún, explain fún, forgive fún and
congratulate fún. The possibility of switching here ensued from the fact that the lexical verbs have the major meaning while the preposition is merely playing a supportive role by just linking the verb to the NP that serves as the complement. Again, switches are allowed only on the second element of the prepositional verbs without any negative repercussion. However, when the second element of the MWE is in English, an embedded language must be formed with this second element as in (18a, 19b, 20b, 21b) to avoid ungrammaticality. Finally, the structure is grammatical if the prepositional verb occurs with a switch (as in 17a, 18b, 20a, 21a & 22), with an intervening element (18, 19, 21 & 22a) and along with embedded language (18a, 19b, 20b & 21b), which are all good cases.

7. Phrasal-Prepositional Verbs

These are verbs followed by two particles: an adverb and a preposition (in that order). Just like what obtains under prepositional verbs, some prepositional phrasal verbs allow switching of their components, but some do not as in the following examples:

23a. Wón ń  look down on  àwọn  neighbours  wọn 
   They  CONT  look down on  PL  neighbours  their
   ‘They are looking down on their neighbours/They look down on their neighbours.’

24a. Wón  put  ẹ̀  up  fún  eviction.
   They  put  3sg  up  for  eviction
   ‘They put her/him up for eviction.’

b. Ó  walk  out on  me!
   ‘You walked out on me!’

There is also a pattern where switching is allowed. However, only the last component of the MWE can be switched.

24b. Ó  put  problem  yên  down  sì  inexperience.
   3sg  put  problem  that  down  to  inexperience
   ‘She/He put the problem down to inexperience.’

c. Mi  ò  lè  put up  pèlù  ẹ̀  mó.
   I  NEG  can  put up  with  3sg  again
   ‘I can’t put up with her/him/it any longer.’
d. Biola *come up pě́lú* new ideas/theory tuntun.
   Biola come up with new ideas/theory new
   ‘Biola came up with new ideas/a new theory.’

In comparison with what happened in the discussion on prepositional verbs, the preposition is observed to be the only item that switches to Yorùbá wherever switching is permitted. This means that the lexical verb and the adverbial particle are not switched. Again, while some phrasal-prepositional verbs allow switching, some do not. This implies that there are different levels of non-compositionality among the MWEs. The more compositional an expression is, the more it permits switches; the less compositional it is, the less it permits switching.

8. Splitting Verbs

Splitting verbs are contributed to the code-switched structure by the Yorùbá substrate. They refer to verbs that have two parts each of which cannot occur independently and be meaningful. Hence, they normally co-occur either as a combined word or as splits in a sentence. According to Awobuluyi (1978: 53), “when used with an object, each verb in this class is always split into two halves, and their object is inserted between them... Many of them have idiomatic meanings.” Examples include *bájé* ‘spoil’, *gbàgbó* ‘believe’ and *túká* ‘disperse.’

When they occur together as a word, splitting verbs can be switched wholly into English as in the following examples:

25a. *Computer yii ti bájé/crash*
    ‘This computer has got spoilt/crashed’

b. *Àwọn students ti túká/disperse*
    ‘Students have dispersed’

c. *Ó gbàgbó/believe pé man yẹn try*
    ‘She/He believed that that man tried.’

However, when they are split, neither part of a splitting verb may be switched into English, but rather English nouns/words can come in between them.
26a. Ọ̀ ba bike mi jẹ́ 3sg bike my do ‘S/he spoilt my bike.’

27a. Ọlọpàà tú àwọn rioters yen ká Police loosen pl rioters those around ‘The police dispersed those rioters’
b. *Ọlọpàà loosen àwọn rioters ká

28a. Farmer yen fún oranges yen ká Farmer that spray oranges those around ‘The farmer threw those oranges about/around.’
b. *Farmer yen spray grains yen ká

29a. Adé tún bike mi sẹ̀ Adé again bike my do ‘Adé repaired my bike.’
b. *Ade again bike mi sẹ̀

30a. Biola báo man yen wí Biola with man that talk ‘Biola rebuked that man.’
b. *Biola with man yen wí

31a. Teacher rẹ́ student ṣẹ́ jẹ́ Teacher cut student his eat ‘The teacher cheated his student.’
b. *Teacher cut student ṣẹ́ jẹ́

32a. Àwọn church members gba pastor won gbó Àwọn church members accept pastor their hear ‘The church members believed their pastor.’
b. *Àwọn church members accept pastor won gbó
33a. *Pastor bẹ̀ àwọn brethren wò
   Pastor check pl brethren look
   ‘Pastor visited the brethren.’
   b. *Pastor check àwọn brethren wò (with the interpretation of 33a)

34a. Boy kan tan friend ẹ̀ jẹ̀
   Boy certain trick friend 3sg eat
   ‘A certain boy tricked his friend.’
   b. *Boy kán tan girlfriend ẹ̀ eat

35a. Chameleon pa colour ẹ̀ dà
   Chameleon paint colour 3sg -
   ‘The chameleon changed its colour.’
   b.* Chameleon paint colour ẹ̀ dà

36a. Bag yen kò bá shoes mu
   Bag that not with shoes parallel
   ‘That bag does not match the shoes’
   b.*Aṣọ yen kò bá ara match
   ‘The clothes did not match his body.’

37a. Títí di pillar mú
   Títí hold pillar take/catch
   ‘Títí held on to the pillar’
   b. *Títí hold pillar mú

38a. Man yen pa second wife ẹ̀ tí.
   Man that - second wife his -
   ‘That man abandoned his second wife.’
   b. *Man yen pa second wife ẹ̀ aside.
39a. *Attitude yẹn bu master wá kù
   Attitude that cut master our remain
   ‘That attitude ridiculed our master.’
   b. *Attitude yẹn cut master wá kù

40a. Wọn pa ideas wọn pọ.
   They combine ideas 3pl together
   ‘They combined their ideas.’
   b. *Wọn pa ideas wọn together.

In these examples, it is difficult to find meanings to parts of the splitting verbs. Hence, ‘-’ is often used instead in some cases. In other cases, meaning that approximates to each half of the splitting verb is presented. The first part of the splitting verb seems to have some sort of meaning which approximates partially to the intended meaning. Throughout these examples, we can see that the splitting verbs are impervious to switching. However, splitting verbs generally allow English words to come in-between them as demonstrated in all the examples presented above.

So, what accounts for the ungrammaticality of the other examples? The major reason for the unacceptability of switching is that each part of the splitting verb is meaningless without the other part. Although each of the parts may be meaningful in some contexts as an individual word, such meanings may not be sustainable when the words are switched into English. This explains why certain halves of the splitting verbs are translatable while the other parts are not.

We conclude, therefore, that splitting verbs maintain their identity in code-mixed structures. Switches of either part of the splitting verb may render the expressions ungrammatical and unacceptable.

9. Serial Verb Constructions

Serial verb constructions (SVCs) are a series of two or more verb roots that co-occur but are not compounded in a sentence (Payne, 1997: 307). However, the tense is often reflected on the first verb (Lawal, 1989; Collins, 1997). The Yorùbá part of the code-switched grammar contributes the SVC structure and English words are switched with them. Again, this confirms the Yorùbá substrate as the host language. Here are some examples: (41-46) are borrowed from Lamidi, (2003):

41. Mo fẹ lọ pray.
   I want go pray
   ‘I want to go and pray.’
42. Kí ni o fi register?
   What you use register
   ‘What did you use to register?’

43. Mo fé record è.
    I want record it
    ‘I want to record it.’

44. Òjó grumble wá síbí.
    Òjó grumble come here
    ‘Òjó grumbled as he came here.’

45. O se rice я.
    You cook:pst rice eat:pst
    ‘You cooked rice and ate it.’

46. Sójá plan coup däràn.
    Soldier plan coup get:into:trouble
    ‘A soldier planned a coup and got into trouble.’

We can subject these examples to different switch patterns and see how the SVCs behave.

47a. *Mo fé go pray.
    b. *Mo like lọ pray.
    c. *Kí ni o use register?
    d. *Mo like record(V) è.
    e. *Òjó grumble come síbí (Lamidi, 2003: 315)

From the good examples, we can see that switches are permitted among components of SVC. From (41-43), the first word in the SVC is in Yorùbá, while the second/third word is in English. In (44 & 46) the second word of the SVC is Yorùbá; and in (45), the SVC is purely in Yorùbá. However, in the bad examples (47a-e), it is shown that it is not every component of the SVC that can be switched; the switches are peculiar to each SVC structure. The ungrammaticality shows that those components of the SVCs
that were switched made the structures ill-formed. Most especially, all the components of the SVC may not be switched (as in 47c-e).

10. Idioms

An idiom is a combination of words with a figurative meaning. Idiomatic expressions can be words, phrases, clauses or sentences. Idioms have a unique meaning, which cannot be pieced together (following the concept of compositionality) from the meaning of individual words in an expression. Rather, the expression has only one unified meaning. In English and Yoruba (as well as other natural languages), idioms and metaphors have a unified meaning that cannot be deduced from the surface structure of individual words. Consider the following code-switched examples:

48a. He *kicked the bucket* ‘He died.’
   b. Ó *kick bucket nêà* (literal translation results: He kicked the bucket.’)
   c. Ó ta *bucket nîpâà* ‘He kicked a (particular) bucket.’

49a. He is *pulling your leg* ‘He is joking with you.’
   b. Ó ñ *pull leg/êsê e* (literal translation: He’s pulling your leg.)

50a. *Lead a dog’s life* ‘live an unhappy life.’
   b. *Eat humble pie* ‘show remorse.’
   c. *Throw in the towel* ‘surrender.’

These idioms are of English language origin. As they are, they may permit switching (as in 49b), but at the cost of the intended meaning. In (48b&c), the meanings of the expressions are literal. Both expressions refer to a particular bucket that an individual kicked or a leg that is pulled. This is different from the intended meaning of someone’s death (48a) and joking (49a). Hence, English idioms do not allow switching, if they must maintain their meaning.

Consider the following Yoruba idioms.

51a. Ó ta *têru nîpâà* ‘He died’
   b. *Ó *kick têru* 3sg kick white-cloth
52a. Gbogbo attempts yen fi orí sánpón
   All attempts that use head -
   ‘All the attempts failed.’

b. *Gbogbo attempts yen fi head sánpón

53a. Àwọn workers ye leader won ni sàà/*period
   Pl workers dislodge leader them at period
   ‘Workers disgraced/lowered the status of their leader.’

b. *Àwọn workers remove leader won from sàà.

In these examples, the idioms of Yorùbá origin resist switching. Apart from the fact that switching makes the expression unacceptable, it is not amenable to literal translations. So, if any word is changed, the meaning of the expression collapses.

11. Conclusions

Having gone through the analyses of different MWEs, we have come to the following conclusions. Switching in MWEs is effected through scopal authority and semantic selection. In scopal authority, the heads subcategorise the particles (if required), determine the kind of particles/words that should follow them and the possibility of switching them to the other language (as we find in 5 and other sections). The first word in a MWE serves as the head which determines whether the next or subsequent word will be switched. Semantic selection determines the logical form or meaning of an expression before and after switching. When switches occur, the meaning may become literal (as in idioms) or remain intact (as in other cases).

Two patterns of switching are found in Yorulish MWEs: (a) Total rejection of switching and (b) partial rejection of switching. While splitting verbs and idioms (especially from Yorùbá) (sections 8 & 10) totally reject switching of their components into the other substrate language, phrasal verbs (section 5), prepositional verbs (section 6), phrasal-prepositional verbs (section 7) and serial verbs (section 9) allow switching in some cases but reject it in others.

This means that there is a hierarchy, starting from the most impervious to the least impervious to switching. The reason for the rejection of switching can be traced to the non-compositional nature of the expressions that reject switching and the flexibility in the composition of those expressions that partially tolerate switching. Hence, we can observe levels of compositionality between two opposites. Those that are impervious to switching are non-compositional, while those that allow mixing are partially
compositional, mixing/switching being more difficult as expressions become more non-compositional.

Finally, although both English and Yorùbá are similar in their sentence typology (they have Subject Verb Object word order), the order of words in each code-mixed structure usually conforms to the pattern in Yorùbá (as discussed in section 5.1). In the few cases where they do not conform, they are embedded language. This confirms that Yorùbá is the matrix language in Yorulish.
