#### Abstract

In this work we present a theoretical approach for the determination of octanol/water partition coefficient of selected ferrocenes bearing different substituents, the calculation is based on the adaptation of the Rekker method. Our prediction of obtained theoretical partition coefficients values of $\log \mathrm{P}$ for all studied substituted ferrocene was confirmed by comparison with known experimental values obtained mainly from literature. The results obtained show that calculated partition coefficients are in good agreement with experimental values. For estimation of the octanol/water partition coefficients of the selected compounds, the average absolute error of $\log \mathrm{P}$ is 0.13 , and The correlation coefficient is $\mathrm{R}^{2}=0.966$.

Key words: experimental logP, theoretical partition coefficient, substituted ferrocene, lipophilicity, QSAR.

## 1. INTRODUCTION

In recent years the octanol/water partition coefficient $\log \mathrm{P}$ has become a key parameter in studies of the environmental fate of organic chemicals. Because of its increasing use in the estimation of many other properties, $\log \mathrm{P}$ is considered a required property in studies of new or problematic chemicals. Although this surmounting interest in octanol/water partition coefficient measurements lays out over the past 90 years, no comprehensive articles of the partition coefficient of ferrocene derivatives have ever been published.

ICID: 1020757

In fact, despite the ferrocene itself, no value of partition coefficients has appeared in the literature. Among the many different theoretical methods for the calculation of $\log \mathrm{P}$ of several simple aliphatic and aromatic compounds, which is described in literature,[1-4] no one of these arithmetic methods can be applied to organometallic compounds, such as ferrocene derivatives. The very rapid expansion of ferrocene chemistry during the last 50 years, notably in areas related to biology, medicine, catalysis and materials [5-9], led us to turn our attention to the octanol/water partition coefficient of ferrocene derivatives, the aim of the present paper is to present a new and simple method for the calculation of this very important parameter that quantifies the lipophilicity of these derivatives and connects between their structure and their biological activities. The calculation used for obtaining $\log \mathrm{P}$ of ferrocene derivatives is based upon the adaptation of the Rekker method used for organic molecules [1-10].
We herein present a simple method for the calculation of this very important parameter that quantifies the lipophilicity of substituted ferrocene. The method used for obtaining $\log \mathrm{P}$ of substituted ferrocene is based upon the adaptation of Rekker method used for organic molecules.

## 2. RESULTS AND DISCUSSION

We describe in this section the generation of our method for $\log P$ calculation for substituted ferrocene. This calculation is based upon the adaptation of the exciting Rekker method, which considers the partition molecular species between an aqueous phase and an organic phase (octanol).

## 3. PRINCIPLE OF THE REKKER APPROACH

The calculation of $\log P$ according to Rekker method, which is a fragmental approach, is based on the decomposition of the molecule into small suitable substructures to which are attributed theoretical hydrophobic values. The contribution of a fragment is represented by a fragmental constant noted $\mathrm{f}_{\mathrm{i}}$ the summing of these values together, taking into account corrections needed for certain intramolecular interactions should give the theoretical value of logP. All type of corrections like resonance, hydrogen bonding, ring fusion, and others requires the addition of a multiple of a constant noted $\mathrm{C}_{\mathrm{M}}$, which Rekker called the "magic constant", the partition coefficient of the considered molecule is given by the following equation:

$$
\begin{equation*}
\log P=\sum_{i=1}^{n} a_{i} \times f_{i}+\sum_{i=1}^{m} k_{i} \times c_{M} \tag{1}
\end{equation*}
$$

Where $f_{i}$ is the fragmental constant, and $a_{i}$ its number, $C_{m}$ is the correction factor, and $\mathrm{k}_{\mathrm{i}}$ the frequency of $\mathrm{C}_{\mathrm{m}}$ that varies with the type of intramolecular interactions and always is an integer not a fraction.

In the following article, calculated partition coefficients using this method are symbolized as $\log P_{\text {cal. }}$, while experimental partition coefficient are symbolized as $\log P_{\text {exp }}$.

### 3.1. Adaptation of the Rekker approach:

Since the theoretical value of the octanol/water partition coefficient $\log P$ of the ferrocene molecule is not known and is not so far described in the literature and since the ferrocene molecule does not contain any hydrogen bonding or any interaction which can affect its value of $\log \mathrm{P}$, we consider the theoretical value of $\log \mathrm{P}$ of the ferrocene molecule is equal to the experimental value which is 2.66[11].

A ferrocenyl group is regarded as a ferrocene molecule minus an atom of hydrogen as demonstrated by the following scheme 1 :

Scheme 1 obtaining of a ferrocenyl group

The contribution of a ferrocenyl group is therefore obtained by the subtraction of a contribution of a hydrogen atom from the ferrocene molecule as indicated by the following relation.

$$
\begin{equation*}
\mathrm{f}_{\mathrm{F}_{\mathrm{C}}}=\log \mathrm{P}_{\mathrm{F}_{\mathrm{C}}-\mathrm{H}}-\mathrm{f}_{\mathrm{H}} \tag{2}
\end{equation*}
$$

Where $\log _{\mathrm{F}_{\mathrm{C}^{-\mathrm{H}}}}$ is the logarithm of the n-octanol/water of ferrocene, $\mathrm{f}_{\mathrm{Fc}}$ and $\mathrm{f}_{\mathrm{H}}$ are the contributions of the theoretical hydrophobic values of the ferrocenyl group and the hydrogen atom, respectively, the numerical application gives:

$$
\begin{equation*}
\mathrm{f}_{\mathrm{FC}}=2.660-0.204=2.456 \tag{3}
\end{equation*}
$$

The $\log \mathrm{P}$, for any ferrocene derivatives $\mathrm{F}_{\mathrm{C}}-\mathrm{X}$, of formula

Fe

Ferrocene derivative
is therefore can be calculated by summing the contribution of a substituent $X$, to the contribution of a ferrocenyl group and adding the corrective term $\mathrm{C}_{\mathrm{M}}$ as given by equation 4

$$
\begin{equation*}
\log P=2.456+f_{X}+\sum C_{M} \tag{4}
\end{equation*}
$$

$C_{M}$ is equal to 0.219 .
$f_{\mathrm{X}}$ can be obtained from[1], $\mathrm{F}_{\mathrm{c}}$ refers to ferrocenyl group
When two substituents are introduced to the ferrocene, the contribution of a ferrocenyl group is calculated in this case as follows:

### 3.2. Calculation and validation of the model

We validated our approach with 10 different ferrocene derivatives (selected from literature sources [12-14]). We recommend carrying out the calculations in three decimals, with the final result rounded to two decimals.

## 4'-ferrocényl-1',4'-[bis-(2-trifluorométhyl-1-cyano-phényl)]-2',5'-

## imidazolidinedione

This compound (1) is an example of ferrocene linked to a direct heterocyclic ring , we propose for these type of molecules a correction factor of $6 \mathrm{C}_{\mathrm{M}}, 3 \mathrm{C}_{\mathrm{M}}$ for the proximity effects and $3 \mathrm{C}_{\mathrm{M}}$ for hydrogen band, $\log \mathrm{P}$ is obtained by the summation of the value of the fragmental constant of the all of fragments in the molecule and the addition of a corrective term ,the method of calculating of $\log \mathrm{P}$ is illustrated in table I-1.

| arNH | 1 | -0.938 | -0.938 |
| Quinolinyl | 1 | $1.821-0.204$ | 1.617 |
| $\mathrm{CH}_{3}$ | 2 | 0.724 | 1.448 |
| $\mathrm{CH}_{2}$ | 2 | 0.519 | 1.038 |
| N | 1 | -2.074 | -2.074 |
| Cl | 1 | 0.933 | 0.933 |
| $\mathrm{k}_{\mathrm{i}} \times \mathrm{C}_{\mathrm{M}}$ | $3 \times 0.219$ | 0.657 |  |
| $\log P_{\text {cal. }}$ |  |  |  |

## 4. (7-Chloro-quinolin-4-yl)-(2-dimethylaminomethylferrocenyl)-methylamine

We propose no correction for these type of compounds, $\log \mathrm{P}$ is calculated as mentioned before, $\log P_{\text {cal }}=4.96$.

## 5. (7-Chloro-quinolin-4-yl)-(2-dimethylaminomethylferrocenyl)-butylamine

We propose no correction for these types of compounds, $\log \mathrm{P}$ is calculated as mentioned before, $P_{\text {cal }}=6.52$.

## 6. (7-Chloro-quinolin-4-yl)-(2-dimethylaminomethylferrocenyl)-isobutylamine

We propose no correction for these types of compounds, $\log \mathrm{P}$ is calculated as mentioned before, $\log P_{\text {cal }}=6.52$.

## 7. 4-(-2-(ferrocenyl )-1-phenylbut-1-enyl)benzonitrile

Ferrocenes with two quaternary carbons bulk arises from thus carbon needs corrector factor $\left(-2 \mathrm{C}_{\mathrm{M}}\right.$ for each $), \log \mathrm{P}$ is calculated as mentioned before, $\log P_{\text {cal }}=6.49$.

## 8. 1-(-1-(-4-amino phenyl)-1-phenylbut-1-en-2-yl)ferrocene

Ferrocenes with two quaternary carbons bulk arises from thus carbon needs corrector factor $\left(-2 \mathrm{C}_{\mathrm{M}}\right.$ for each carbon), $\log \mathrm{P}$ is calculated as mentioned before, $\log P_{c a l}=5.74$.
9. N -(4-(-2-(ferrocenyl )-1-phenylbut-1-enyl)phenyl)acetamide

Ferrocenes with two quaternary carbons bulk arises from thus carbon needs corrector factor ( $-2 \mathrm{C}_{\mathrm{M}}$ for each), $\log \mathrm{P}$ is calculated as mentioned before, $\log P_{\text {cal }}=5.80$.
In order to analyze the errors of our results for calculated partition coefficient $\log \mathrm{P}_{\text {cal }}$, the absolute error AE of $\log \mathrm{P}$ is calculated according to the following relation.

$$
\begin{equation*}
\Delta \log P=\left|\log P_{\text {calc. }}-\log P_{\text {exp. }}\right| \tag{6}
\end{equation*}
$$

The results are summarized in table II-5.

Table I-5. Estimation and absolute error results for ferrocene derivatives

| compound | $\operatorname{logP}_{\text {calc. }}$ | $\log \mathrm{P}_{\text {exp. }}[12-14]$ | AE |
| :---: | :---: | :---: | :---: |

| 10 | 5.80 | 5.92 | 0.12 |

Fig.1. correlation between experimental $\log P$ and calculated $\log P$ for substituted ferrocenes

## 4. CONCLUSION

In this study we successfully find a theoretical method for the estimation of the octanol/water partition coefficients of substituted ferrocene. The calculations are based on Rekker method starting from ferrocene compound. After having adapted this method for the calculation of partition coefficient, we became able, for the first time, to apply this method for calculations of the partition coefficient of substituted ferrocene. Values of experimental and calculated $\log \mathrm{P}$ for a series of substituted ferrocene are in good agreement.
