**Supplementary figure 1:** Pulley system of the finger flexor tendons, illustrating the positions of five annular ligaments (A1–A5) and three cruciate ligaments (C1–C3). Ruptures of A2 and A4 are common injuries suffered by human rock climbers. Image modified from Schöffl et al.<sup>1</sup> with permission.

**Supplementary figure 2:** Variation in the force ratio of marginal and central pulley fibers as a function of the tendon angle that results from varying degrees of phalangeal curvature, as measured by the included angle ( $\theta$ ). Figure concept and extrapolations are based on the model of Tan et al.<sup>2</sup> Data sources for  $\theta$ : Stern et al.<sup>3</sup> (*Homo sapiens*) and this study (*H. naledi*).

**Supplementary table 1:** Lengths (mm) of the intermediate phalanx (IP) and distal phalanx (DP) of manual digits 2–5 in a skeletal sample of chacma baboons (*Papio ursinus*) at the Evolutionary Studies Institute (ESI) and School of Anatomical Sciences (WSAS), University of the Witwatersrand
